PROFESSIONAL SUMMARY

Java/Spring Boot engineer with 4+ years building backend systems that ship to real users. At Grithika Labs, I led the design of an AI-powered data querying service that cut client reporting time by 60%; at Prodapt, I owned a feature end-to-end that moved a client retention metric by 20%. I care about clean API contracts, test coverage that means something, and code the next engineer won't dread reading. Looking for a backend-focused role where I can take ownership of systems at scale and work on problems that have real user impact.

SKILLS

Languages & Core: Java (Primary), Python, C, JavaScript, Data Structures (Arrays, Strings)

Frameworks & Tools: Spring Boot, Spring Security, Hibernate/JPA, Maven, Git, JUnit

API & Integration: REST APIs, OpenAPI/Swagger, JSON, Postman, JWT Authentication, HTTP/REST Protocols

Databases: MySQL, MongoDB, Oracle SQL, H2, SQLite, JDBC

Architecture & Cloud: Microservices, AWS, Docker, WebSocket

Frontend (Exposure): React, HTML, CSS, Thymeleaf, Bootstrap, Streamlit

EXPERIENCE

Software Engineer | [Grithika Labs](#) | Bengaluru, KA, India

08/2023 – Present

- Built an AI-powered data querying service in Java/Spring Boot using the OpenAI API — clients went from manual spreadsheet digging to natural-language queries, cutting reporting time by 60%.
- Designed **RESTful APIs** for CSV/Excel ingestion with Apache POI; handled in-memory parsing and fed structured data into the AI pipeline for dynamic responses.
- Locked down all endpoints with **JWT** and **Spring Security** — role-based access control covering every route, with no unauthorized access issues in production.
- Added chart generation (bar, line, pie) via JFreeChart triggered by AI-interpreted prompts; replaced manual reporting for 3 client teams entirely.
- Kept unit test coverage above 85% with **JUnit** and **Mockito** — partly because I inherited code without tests and had to fix that before adding anything new.
- Wired a Streamlit frontend into the Spring Boot backend for client demos; used in 5+ onboarding sessions to show the full query-to-chart flow live.

Software Engineer | [Prodapt Solutions](#) | Bengaluru, KA, India

01/2023 – 07/2023

- Worked on Java microservices in **Spring Boot** and **Hibernate** for a telecom client — the system handled 10K+ daily requests and had near-zero tolerance for downtime.
- Dug into slow SQL queries across core modules and refactored the worst offenders; average API response times dropped **30%** without touching the architecture.
- Took full ownership of a critical client feature — wrote the **LLD**, coded it, and pushed it to production within the sprint — contributing to a 20% improvement in client retention.
- Built JWT-secured APIs for third-party integrations; wrote clear contracts so external teams could integrate without back-and-forth.
- Worked across product, frontend, and QA in daily standups and sprint reviews — mostly focused on keeping production stable and blockers resolved fast.

Java Developer | [Shivila Technologies Pvt Ltd](#) | Kolkata, WB, India

02/2022 – 12/2022

- Built real-time pricing feeds using **WebSocket** on **AWS** — users saw live updates without polling, which was the main reason the feature worked at all.
- Set up Spring Security and JWT token flow for API auth; became the go-to pattern across 3 product modules after the first implementation held up well in production.
- Integrated JDBC with H2 and SQLite for local dev — cut environment setup time by 40% because devs no longer needed a running DB instance to get started.
- Built the email notification service for registration and messaging; completion rate on the onboarding funnel went up 15% after it went live.

- Documented REST API contracts for frontend and third-party teams — reduced integration back-and-forth by 25% because the specs were actually usable.
- Refactored startup sequences and memory-heavy resource handling; got startup time down and trimmed memory overhead by roughly 20%.

PROJECTS

Hospital Management System

- Built a Hospital Management System covering 7 user roles — each module had its own access scope and workflow, so the data model and API layer had to be designed carefully from the start.
- Designed the MySQL schema with stored procedures and query tuning to handle concurrent access across all modules; no module blocked another under load.
- Exposed data between modules via Spring Boot REST APIs and built role-specific Thymeleaf dashboards so each user type saw only what was relevant to them.

Tech: Java, Spring Boot, MySQL, REST APIs, Thymeleaf, Bootstrap, HTML/CSS

EDUCATION

Bachelor of Technology — Computer Science & Engineering

08/2015 – 08/2019

BBDIT, AKTU University — Ghaziabad, UP, India

CERTIFICATION

Java & Testing — ABC For Technology & Training, Bengaluru

09/2019 – 04/2020
